

# Power Take-Off Clutches

## Superior Torque Control for Heavy Duty Diesel Engines

Wichita has instituted quality assurance procedures aimed at achieving the ultimate in product reliability and its Power Take-Offs represent industry's most advanced PTO design.

Two mechanically activated PTO's are now available in addition to the performance-proven Air Tube Disc Clutch PTO's. Complete clutch engagement of the mechanical PTO units is assured with each release of the hand lever due to the incorporation of a heavy-duty Fuller® "Solo" truck clutch. With its many outstanding features, the Fuller clutch used in the Wichita PTO prevents torsional vibration from damaging engine or transmission components, or causing spline wear. The result is superior Power Take-Off performance and durability!

### Mechanical Power Take-Off Clutches

**In-Line PTO**  
2 sizes

**Side Load PTO**  
2 heavy duty models

**Air-Tube Disc Power Take-Off (PTO) Clutches**  
3 sizes

### Typical Applications

The In-line PTO design provides direct drive operation with side load capability. It has an automatic self-adjusting feature and does not require a pilot bearing. Other features such as standard SAE flywheel mounting, interchangeable clutch and clutch housing, constant plate load and easy maintenance add up to superior performance.

Wichita 15-1/2" mechanical PTO provides long service life for Cummins 855 diesel on rock crusher.

Side Load PTO's utilize a pair of heavy-duty roller bearings fitted in to the shaft housing. The bearing support system eliminates the transmission of side loads that could reduce durability or even damage the engine's crankshaft. Its torque capacities range up to 420 HP @ 2100 RPM.

Wichita mechanical PTO handles shock and heavy loads for wood chippers.

Air-Tube Disc Power Take-Off Clutches provide dependable trouble-free performance on indirect drives with large overhung loads on engines of 250-700 HP. The Wichita design isolates the side load from the engine's crankshaft for long service life. Simple air controls can be utilized to remotely control the clutch as well as the throttle. Wichita PTO's have been successfully used for oil field, construction and marine applications.

Wichita PTO mounted on Caterpillar diesel engine.

# Power Take-Off Clutches

## Mechanical Design

## Design Features

- Side Load version incorporates a rugged cylindrical roller bearing system which eliminates trouble-prone pilot bearings. Provides 100% external support of take-off shaft. Prevents transmission of side loads that fatigue or even damage the engine crankshaft.
- Precise alignment capabilities of the bearing system ensure flywheel/clutch concentricity to minimize effects of diesel engine torsional vibration.
- Performance-proven Fuller Solo Spring clutch provides easy engagement. Axial load is provided by three pairs of springs placed at an angle to the clutch centerline, reducing required axial force as the clutch is disengaged. The discs are raced with trapezoidal ceramic buttons, and are dampened with an assembly of coaxial springs mounted in the disc hub.
- Dampened clutch discs prevent torsional vibrations from damaging engine or components.
- Available in 2 sizes, from 14" to 15 1/2" for engines up to 420 HP @ 2100 RPM.

## Mechanical In-line PTO (Truck Flywheel)

Size 14" Flat, 14" Pot & 15-1/2" Flat

### Dimensions: inches

Clutch Size	SAE Bell Housing	A Pilot (+.000/- .002) in.	B Hole Circle	C Plate Dia.	D	E Hole Size - Qty	F
14" Flat	1	16.50*	15.500	13.56	N/A	13/32 8	2.62
14" Pot	1	14.750	15.500	13.75	2.94	13/32 8	2.50
15-1/2" Flat	1	17.155	16.625	15.22	0.19	15/32 8	2.50

\* Nominal diameter only, clutch is not piloted.

### Caution: Do not use with Drive Line

Center of gravity is 242 lbs. located 3.50" from bell housing mounting surface

### Estimated Side Load Calculation

$$\#1 \quad L = \frac{126,000 \times \text{HP}}{N \times D} \times F \times \text{SF}$$

$$\#2 \quad L = \frac{1,945,000 \times \text{kW}}{N \times D} \times F \times \text{SF}$$

L = Actual Applied Load (lbs. for #1 and kgs for #2)

N = Shaft Speed (RPM)

D = Pitch Diameter (in. for #1 and mm for #2) of Sheave

F = Load Factor

1.0 for Chain Drive or Gear Drive

1.5 for Timing Belts

2.5 for All V-belts

3.5 for All Flat Belts

SF = Service Factor

2.1 for Reciprocating Compressors and other severe shock drives

1.8 for Large Inertia Drives such as Crushers, Chippers, and Planers

### Allowable Side Load (lbs.) at 1,800 RPM

X Distance from Bell Housing	Side Load (lbs.) B <sub>10</sub> Bearing Life
3.62	1,600
4.62	1,100
5.62	850
6.62	680
7.62	565
8.62	450
9.62	400
10.26	370
11.25	340

At 2,100 RPM, derate side load by 20%.

Note: It is recommended that the optional support plate be used in side load applications.

8-560-320-017-0	15-1/2" Truck to 14" Industrial	1 to 1
8-560-320-073-1	15-1/2" Truck to 18" Industrial	1 to 0

## Mechanical Side Load PTO

### HP Rating based on side load using 12-1/2 P.D., 8-8V groove sheave at max. SF.

Speed	Bearing Carrier	Clutch Only
1,800	200 HP	360 HP
2,100	225 HP	420 HP

<sup>1</sup> See chart "A", on page 123.

<sup>2</sup> 15-1/2" Flat, Side Load PTO uses conversion kit 8-560-320-073-1.

<sup>3</sup> Old style flywheel, often not available on new engines.

See Engine manufacturer for flywheel availability.

## Estimated Side Load Calculation

$$\#1 \quad L = \frac{126,000 \times \text{HP}}{N \times D} \times F \times \text{SF}$$

$$\#2 \quad L = \frac{1,945,000 \times \text{kW}}{N \times D} \times F \times \text{SF}$$

L = Actual Applied Load (lbs. for #1 and kgs for #2)

N = Shaft Speed (RPM)

D = Pitch Diameter (in. for #1 and mm for #2) of Sheave

F = Load Factor

1.0 for Chain Drive or Gear Drive

1.5 for Timing Belts

2.5 for All V-belts

3.5 for All Flat Belts

SF = Service Factor

2.1 for Reciprocating Compressors

and other severe shock drives

1.8 for Large Inertia Drives such as

Crushers, Chippers, and Planers

# Power Take-Off Clutches

## Selection Example:

To properly select a Power Take Off (PTO), the following information is needed:

1. Power transmission type: Inline or Side Load
  2. Application engine horsepower @ speed
  3. Peak engine torque
  4. SAE bell housing size
  5. New engine installation or retrofit to an existing engine
  6. Duty selection: See chart "A", page 123  
Chart "A" gives application requirements ranging from "Light" to "Normal" duties (A to B) and "Heavy" to "Extra Heavy" duties (C to D)
  7. Inertia of machine/load
  8. Pitch diameters of drive and driven sheaves\*\*\*\*
  9. Width of drive sheave on Power Take Off shaft\*\*\*\*
- \*\*\*\* Not applicable to inline drives

## Machine Requirement:

Machine Required:	Mud Pump – Triplex piston type
Installation:	New engine installation
Power Transmission Type:	Side load
HP & Speed:	300 HP @ 1,800 RPM
Engine Peak Torque:	1,120 lb.ft.
SAE Bell Housing Size:	SAE bell housing 1
PD* Driver Sheave on PTO:	12.5 in.
PD* Driven Sheave on Mud Pump:	15.0 in.
Width of Driver Sheave on PTO:	9-3/8 in. (8 grooves – 8V section Belt Sheave**)
WR <sup>2</sup> – Inertia of Pump:	108 lb.ft. <sup>2</sup>

\* PD is Pitch Diameter of sheave/pulley.  
\*\* See manufacturer for sheave details.

## Calculations:

1. Application Torque =  $HP \times 63,000/RPM = lb.in.$   
 $300 \times 63,000/1,800 = 10,500 lb.in.$
2. Engine Peak Torque =  $lb. ft. \times 12 = lb.in.$   
 $1,120 \times 12 = 13,440 lb.in.$
3. Mud Pump's Speed =  $\frac{Engine\ Speed \times P.D.\ of\ PTO's\ sheave}{P.D.\ of\ Mud\ Pump's\ sheave} = RPM$   
 $1,800 \times 12.5/15 = 1,500 RPM$
4. Reflect Pump's inertia up to PTO's shaft =  $Pump's\ Inertia \times \left(\frac{Pump's\ speed}{PTO's\ speed}\right)^2 = lb.ft.^2$   
 $108 \times \left(\frac{1,500}{1,800}\right)^2 = 75 lb.ft.^2 @ 1,800 RPM$
5. PTO's clutch slip time, (sec.) =  $\frac{WR^2 \times PTO's\ speed}{25.6 \times Application\ Torque}$   
 $= \frac{75 \times 1,800}{25.6 \times 10,500} = 1/2 sec.$
6. Estimate Side Load, (lbs.) =  $\frac{HP \times 378,000}{Engines\ Speed \times PTO's\ sheave\ PD}$   
 $\frac{300 \times 378,000}{1,800 \times 12-1/2} = 5,040 lbs.$

## How to Select:

### Part 1. PTO Clutch Calculation Follows:

1. Select clutch duty from field of application = Reference chart "A", page 123, Petroleum production shows Mud Pump under duty "D"
2. Determine required HP/100 RPM duty capacity =  $Application\ torque/630 = HP/100\ RPM$   
 $10,500/630 = 16-2/3 HP/100\ RPM$
3. Select clutches based on duty = On clutch capacity chart, page 149, shows the following clutches have sufficient capacity.  
14" Pot, 15-1/2" Flat & 15-1/2" Flat HC  
a.) This is a new engine installation and Note 3 states that there may be an availability problem with the 14" Pot style clutch.  
b.) There is not an advantage in capacity to warrant the use of the 15-1/2" Flat HC style clutch. Therefore, preliminary selection of the clutch is the 15-1/2" Flat style clutch.
4. Peak torque verses clutch torque = On "C" and "D" duty applications, it is required that the clutch torque is greater than engine's peak torque.  
15-1/2" Flat clutch torque from clutch specifications chart on page 149 is 19,800 lb. in.  
Engine's peak torque is 13,440 lb.in.  
Clutch torque > Engine's peak torque  
19,800 lb.in. > 13,440 lb.in.
5. Speed = Clutch capacity chart shows that it has a speed limit of 2,100 RPM which is greater than the required speed of 1,800 RPM.
6. Clutch slip time, (sec.) = Clutch capacity chart shows maximum clutch slip time as 3 sec. which is greater than the calculated 1/2 seconds.

### Part 2. Side Load Calculation Follows:

- Center of sheave's side pull =  $Sheave\ width/2 = (9-3/8)/2 = 4-11/16 in.$
- Locate dimension from Bell housing to shaft's end = 20-15/16 in.  
Reference specific PTO drawing  
15-1/2" Flat PTO side load, page 148.
- Determine "X" distance on PTO = (Bell hsg. to shaft's end dim.) - (Center of sheave's side pull)  
 $(20-15/16) - (4-11/16) = 16-1/4 in.$   
Round "X" distance to the nearest whole number = 16 in.
- Look up side load = Check side load at PTO's speed and "X" distance  
Page 148, allowable side load.  
At "X" distance of 16 in. and 1,800 RPM, chart yields a side load capacity of 5,800 lbs.
- Comparison on side load = Side load capacity > Required side load  
5,800 lbs. > 5,040 lbs.

## Final Selection:

- 15-1/2 in. Flat power take off,  
Side load version with SAE "1" Bell Housing  
Power take off chart, page 149, lists the associated parts lists and drawings.  
Parts Lists Number = 6-715-299-208-0  
Drawing Number = 6-715-202-912-9

# Power Take-Off Clutches

## Air-Tube Disc Design (Industrial)

Ideal for automatic controls

Disc design provides smooth shock-free start-ups

High-speed air tube not affected by centrifugal force

No O-rings or diaphragms to wear out

Bearing support eliminates sideload on crankshaft

### Design Features

- Disc design provides smooth, shock free start-ups.
- Air activated-ideal for automatic or remote controls.
- Bearing support eliminates sideload on crankshaft.
- High speed air tube not affected by centrifugal force.
- No O-rings or diaphragms to wear out.
- Dynamically balanced for high speed operation.
- Models available for all popular diesel engines. Up to 700 HP capacity.

## Allowable Side Load (lbs.) at 1,800 RPM

Type A	Distance X from base mount-in.	Load lb.	Distance X from base mount-in.	Load lb.
	0	—	14	8,900
	4	5,400	16	7,100
	6	6,300	18	6,000
	8	7,500	20	5,100
	10	9,200	22	4,400
	12	12,000	24	4,300

Note: Derate by 20% for 2,100 RPM.

Type B	Distance X from base mount-in.	side load lb.	Distance X from base mount-in.	Load lb.
	—	—	12	4,400
	4	11,500	13	4,100
	5	9,600	14	3,800
	6	8,200	15	3,600
	7	7,200	16	3,400
	8	6,400	17	3,200
	9	5,800	18	3,000
	10	5,200	19	2,900
	11	4,800	20	2,800

Note: Derate by 20% for 2,100 RPM.

## Type C 6,500 lb. Max. side load.

Note: Derate by 20% for 2,100 RPM.

## Clutch Specification Table

Clutch Model	Recommended Maximum PTO HP/100 RPM	Clutch Siip Torque lb.in. at 100 PSI .3 CF.*	Recommended Maximum PTO HP/100 RPM With Heavy Duty Friction Disc
214H	18	71,600	23
118	21	64,500	27
218	42	129,000	54

\* Recommend only 25% of rated torque on PTO's (in.lbs.) - 30% with heavy duty disc.

Note: For mounting, use socket head capscrews conforming to the ASTM-574-97a. Support plate must be perpendicular to sideload pull.

## Estimated Side Load Calculation

$$\#1 \quad L = \frac{126,000 \times \text{HP}}{N \times D} \times F \times \text{SF}$$

$$\#2 \quad L = \frac{1,945,000 \times \text{kW}}{N \times D} \times F \times \text{SF}$$

L = Actual Applied Load (lbs. for #1 and Kgs for #2)

N = Shaft Speed (RPM)

D = Pitch Diameter (in. for #1 and mm for #2) of Sheave.

F = Load Factor

1.0 for Chain Drive or Gear Drive

1.5 for Timing Belts

2.5 for All V-belts

3.5 for All Flat Belts

SF = Service Factor

2.1 for Reciprocating

Compressors and other severe

shock drives

1.8 for Large Inertia Drives such as

Crushers, Chippers, and Planers

F
