

# Magnetic Particle Brakes and Clutches

**Accurate torque control with instantaneous engagement!**

## Available in a wide range of models and sizes

Warner Electric's magnetic particle brakes and clutches are quiet and clean and provide outstanding performance in slipping and torque control applications. They are ideal for unwind, rewind, and intermittent (point to point) tension applications. They are also ideal for controlled starting or stopping, torque limiting and cycling applications.

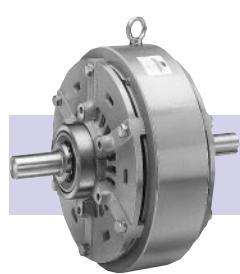

These units use high quality materials and unique designs to provide precision performance, superior heat dissipation and extremely long life. The magnetic powder, made from a patented alloy, provides extreme resistance to heat and wear, and, therefore, promotes long life and high thermal ratings. Also, one of the brake models, the PTB, incorporates a patented heat pipe that further extends its thermal capability. PTB units have thermal ratings three times higher than brakes with natural cooling and equivalent to water-cooled brakes.

### Brakes

Six different brake models are available: four with male shafts and two

with hollow bores. The units with hollow bores can be shaft-mounted, if desired. Final selection is determined by torque and thermal requirements. The product selection section provides more specific information on these models.

### Clutches

Three different clutch models, each with several sizes, are available to

handle a variety of applications. The face-mounted models can be used in parallel or inline applications. The shaft-mounted units offer a second option for parallel shaft applications and are ideal for tension rewind applications. Please see the product selection section for more specific information.

## Features and Benefits

### Precise Control

- Spherical particles provide smooth torque independent of speed. Low speed chatter is also eliminated.
- The magnetic circuit is designed to produce torque proportional to current.
- Unique design requires only one powder seal, thus reducing drag torque and allowing for a wider operating range.

### Extremely Long Life

- Spherical particles made from a patented alloy provide outstanding resistance to corrosion and mechanical breakdown.

### High Heat Dissipation

- One of the models, the PTB, uses a patented heat pipe that provides heat dissipation levels equal to water-cooled units and several times greater than natural cooling.
- The shaft mounted clutches provide self-cooling through the use of an integral fan that rotates with the input.

### Clean Operation

- All models are completely enclosed. Ideal for applications where clean operation is desired.

### Easy to Mount

- Precision pilots are provided to position units for easy installation.
- Clutches and brakes with hollow bores are offered for applications where shaft mounting is desired.

### Smooth Engagement

- Torque characteristics provide for smooth and controllable acceleration or deceleration of the load.

### Fast Response

- Fine particles respond quickly to field for millisecond engagement, if required.

### No Maintenance

- Adjustment or lubrication is not required.

### Quiet Operation

- Engagement is smooth and quiet.

### Low Current Draw

- Efficient magnetic circuit design allows for minimal current draw.

### Torque independent of slip speed

Torque is transmitted through magnetic particle chains that are formed by an electromagnetic field. The torque is independent of slip speed, depending only on circuit current, and is infinitely variable from 0 (disengaged) to rated torque.

### No wearing parts

There are no friction surfaces to grab or wear, and the units are not affected by changes in atmospheric or other environmental conditions.

### Efficient/Compact design

High torque to size ratio and low electric power consumption.

### Versatile mounting

Convenient bolt circle for easy mounting. Mounting brackets available for all sizes. Brakes are available with solid shafts and through bores. Can be mounted horizontally or vertically to solve virtually any motion control requirement.

### Distributor Item

Off the shelf availability. Interchangeable with industry standard sizes.

## Specials Designs

### ▪ **Special Shaft Configurations**

Customer specified shaft configurations for easy machine mounting and retrofitting.

### ▪ **Wash Down Environment**

Stainless steel units available for extreme environments.

### ▪ **Special Torque**

Maximum torque configurations to meet customer specifications.

### ▪ **Special Mounting Configurations**

Customer specified bolt patterns, special mounting brackets.

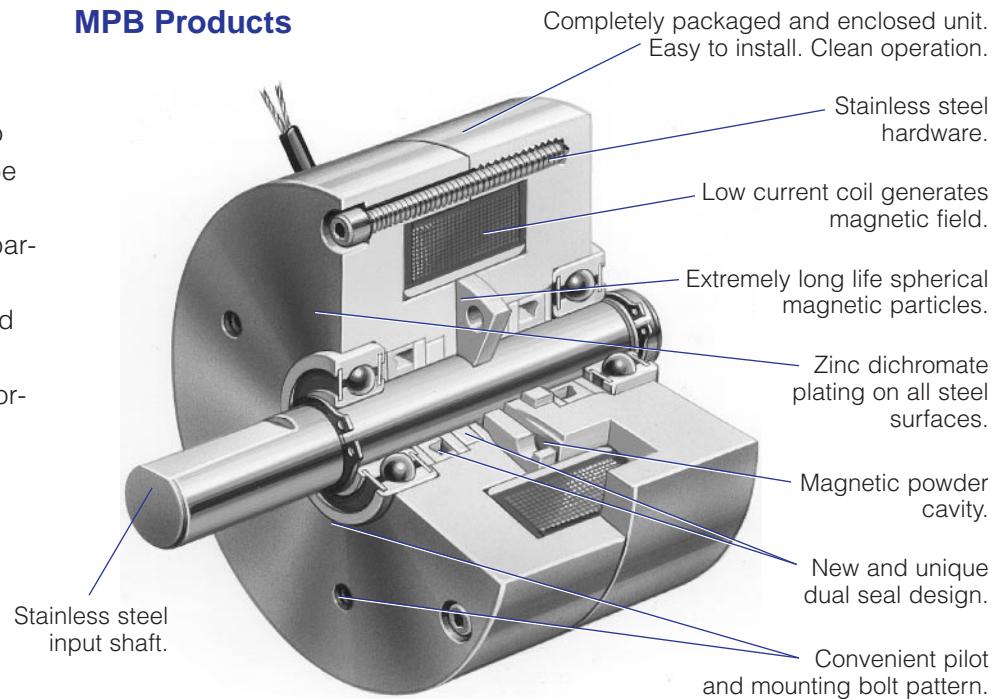

### ▪ **Metric units**

# Magnetic Particle Brakes and Clutches

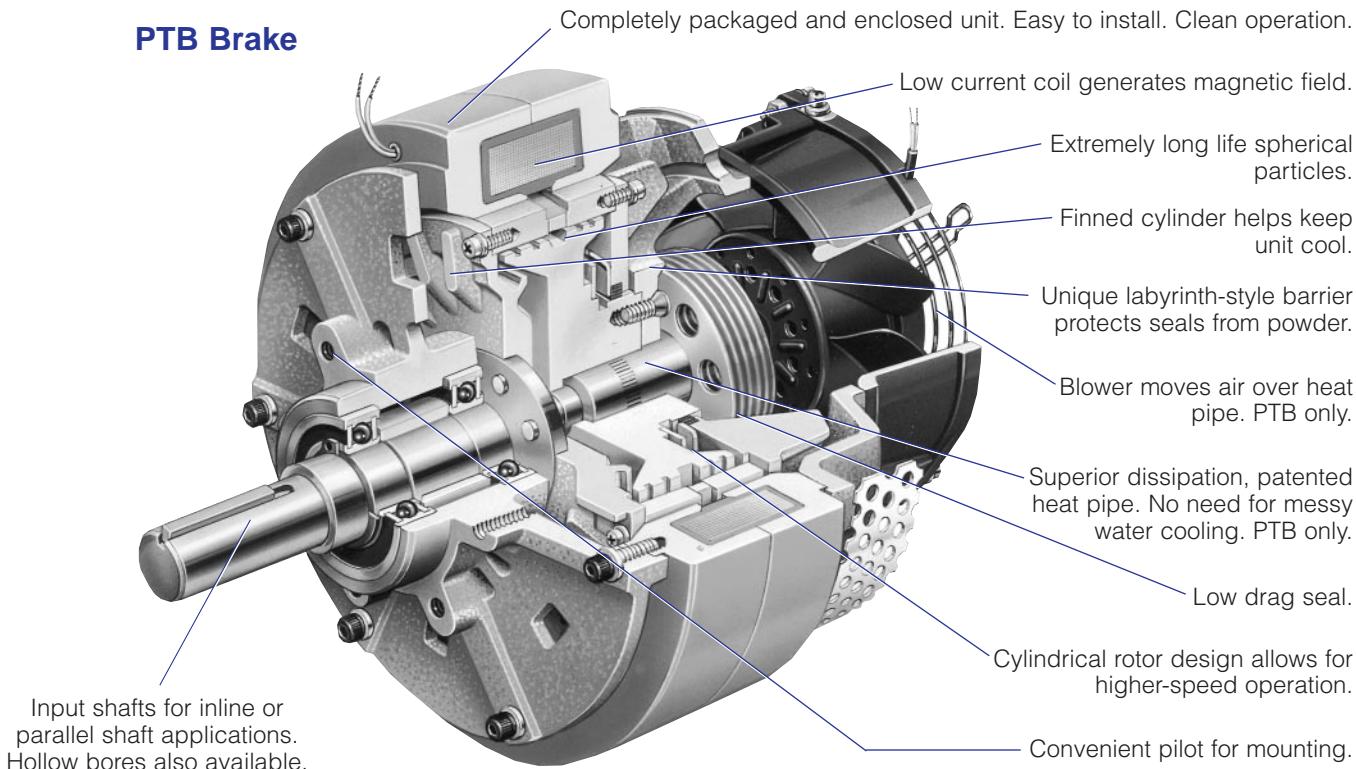

## Design and Operation

Warner Electric magnetic particle clutches and brakes are unique because of the wide operating torque range available. Torque to current is almost linear and can be controlled very accurately. The unique features of the magnetic particle clutches and brakes make them ideal for tension control, load simulation, cycling/ indexing, and soft starts and stops. Controls information starts on page 40.

## MPB Products

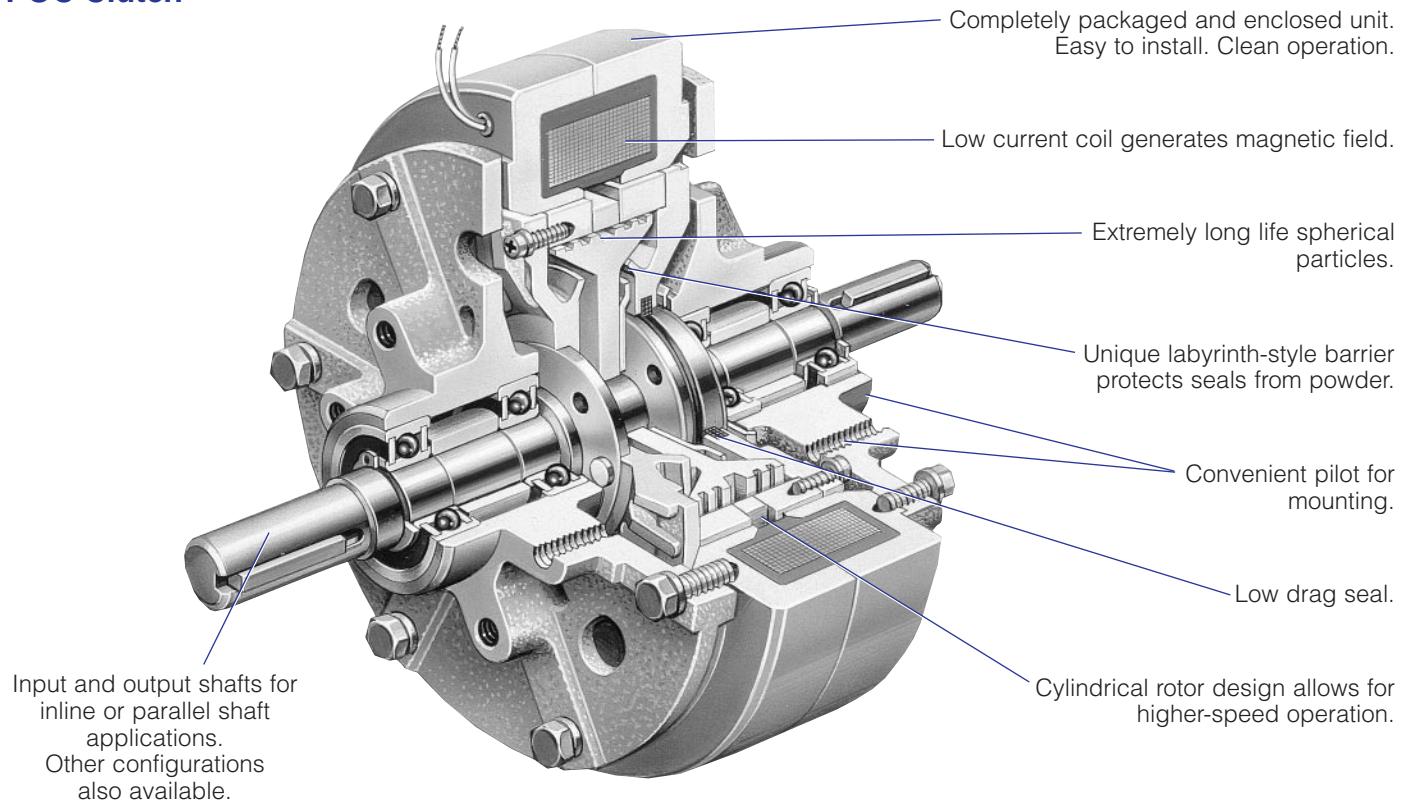

## PTB Brake

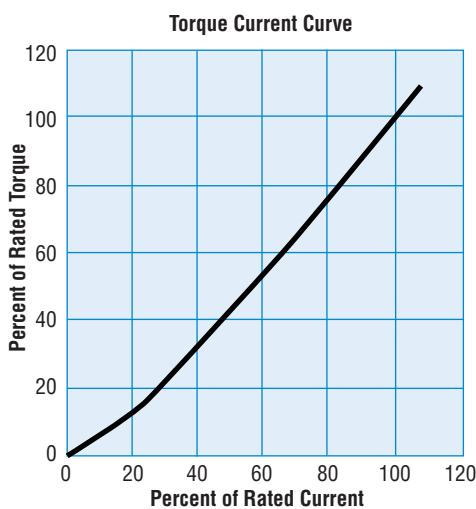

# Magnetic Particle Brakes and Clutches

## POC Clutch

## Principle of Operation

The magnetic particle unit consists of four main components: 1) housing; 2) shaft/disc; 3) coil and 4) magnetic powder. The coil is assembled inside the housing. The shaft/disc fits inside the housing/coil assembly with an air gap between the two; the air gap is filled with fine magnetic powder.

### Engagement

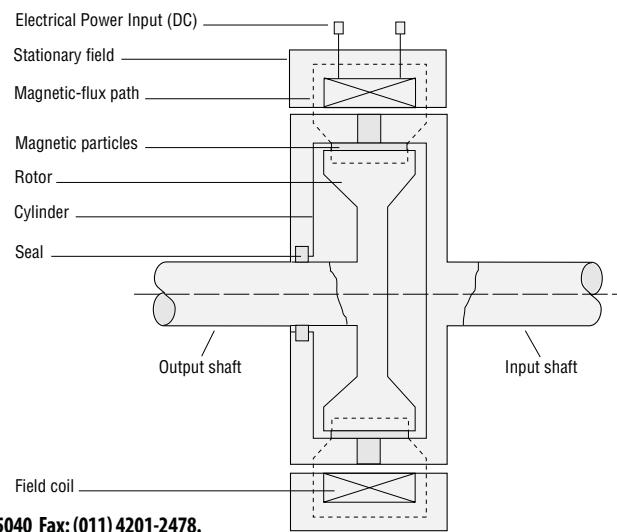

When DC current is applied to the magnetic particle unit, a magnetic flux (chain) is formed, linking the shaft/ disc to the housing. As the current is increased, the magnetic flux becomes stronger, increasing the torque. The magnetic flux creates extremely smooth torque and virtually no "stick-slip".

### Disengagement

When DC current is removed, the magnetic powder is free to move within the cavity, allowing the input shaft to rotate freely.

### Cycling

A cycling effect is achieved by turning the current to the coil on and off.

# Magnetic Particle Brakes and Clutches

## Selection

Unit torque ratings go from as low as 2.0 lb.in. to as high as 578 lb.ft. Also, many models are available to handle specific mounting requirements. The clutch family has three options. The MPC and POC have shaft inputs and outputs and is ideal for inline applications. The PHC models have a hollow bore and can be shaft-mounted for parallel shaft applications. The PMC clutch covers the lower end of the torque range and has a flanged input hub. Also, this unit is often mounted as a brake.

The brake family includes seven models. The MPB covers the low torque ranges and comes with shaft inputs or hollow bores. The POB is a shaft input brake that covers the medium and high torque extremes of the torque range. The PRB series covers the mid range. With four models that have different input and housing options. The PTB model uses a patented heat pipe cooling method that has a cooling capacity equivalent to water-cooled units, but without the hassles of water cooling.

## Selection Requirements

To properly size a magnetic particle brake or clutch, torque transmitted and heat generated must be considered. If you know these values, refer to the specifications and thermal curves to select a unit. For sizing and selection calculation see pages 13 through 30. To select a control for your application refer to the control section on pages 40 & 41.

Product	Model	Torque Ratings (lb.ft.)	Heat Dissipation Ratings Watts [HP <sub>T</sub> ]

# Magnetic Particle Brakes and Clutches

Description	Cooling Method	Applications	Dimension Drawings (page no.)
Low and high torque units. Light duty thermal. All brakes have output shafts and pilots for mounting. Optional brackets available.	Natural	Tension unwind, light duty unwind	102
Low and high torque units are offered in this model. All units have male input shafts and pilots for mounting, except for the size 80, which is foot-mounted.	Natural	Tension unwind	104–105
This is the basic PRB model. It is offered with a hollow bore and a pilot for mounting.	Natural	Tension unwind	106
Like the PRB-H, this model has a hollow bore and mounting pilot, but it also has a finned housing for increased heat dissipation.	Natural with finned housing	Tension unwind	107
This model has a pilot for mounting, like the PRB-H. However, it has a male input shaft instead of a hollow bore.	Natural	Tension unwind	108
This version of the PRB has both the male input shaft and a finned housing for increased heat dissipation. It also is pilot mounted.	Natural with finned housing	Tension unwind	109
The PTB-BL3 offers superior heat dissipation capability. Units are pilot-mounted and a male input shaft is provided for connecting to the load.	Heat Pipe with 115VAC blower	Tension unwind, load for testing. Ideal for applications requiring high heat dissipation	103
These units offer precise control in the small tension ranges. They have flanged input hubs and double-ended output shafts for maximum mounting flexibility. They can be easily mounted as clutches or brakes.	Natural	Tension unwind or rewind, soft start or stop, torque limiting	110–111
Low and medium torque units for light duty rewind applications. Shaft in-shaft out with pilots, allow for sample mounting. Optional brackets available.	Natural	Tension rewind, light duty rewind	112
This model has a hollow bore, making it ideal for applications where shaft mounting is preferred. It has a piloted input flange for pulley or sprocket attachment.	Self-cooling with integral fan	Tension rewind, soft start	113
This model is preferred in many applications. It is offered with male input and output shafts and all units are pilot mounted, except for the size 80. This largest unit, the size 80, is footmounted.	Natural	Tension rewind	114–115

# Magnetic Particle Brakes and Clutches

## Selection Requirements

### Torque

The torque required is calculated differently for different applications. For tension applications, torque is a function of roll radius and tension. For controlled starting and stopping, torque is a function of inertia, speed, and desired time to start or stop the load. For torque limiting applications, allowable drive through torque is used to select a unit. Please follow the selection example that applies to your application to determine the torque required in units of pound-feet.

### Heat

When a brake or clutch is slipping, heat is generated. This is the result of mechanical energy being converted to thermal energy. Tension applications are considered continuous slip applications. Heat generated is a function of tension and linear material speed and is generally described in terms of "thermal horsepower" (HPt). For starting and stopping applications, heat is generated when the unit slips during the stopping and starting of the load. Here heat is a function of speed, inertia, and cycle rate, and is described in terms "energy rate" (ft. lbs./min.). The selection example that fits your application will determine heat in the appropriate units.

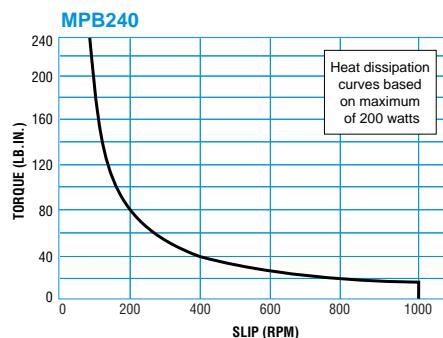

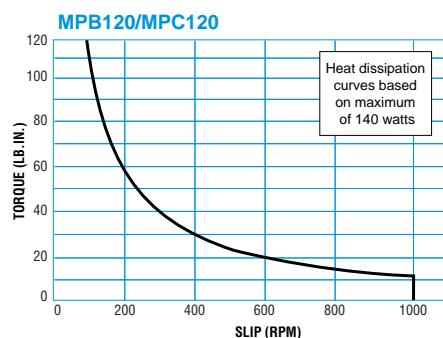

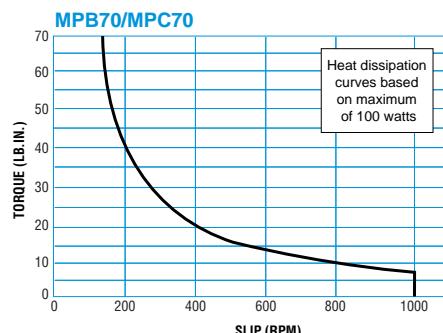

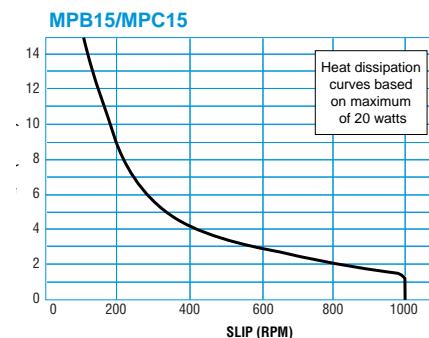

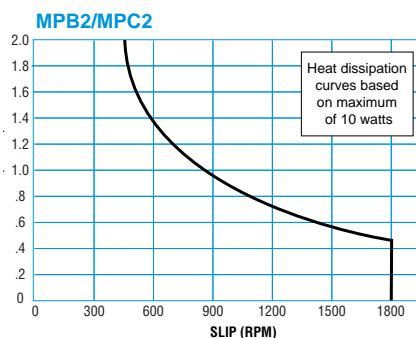

The amount of energy the application produces must be less than the capabilities of the clutch or brake to dissipate. If the energy generated by the application is greater, then the controlling device will be destroyed from excessive heat buildup.

Environmental considerations such as -25°F to +140°F (-31.7°C to +60°C) high ambient temperature can reduce the unit's ability to dissipate heat. For applications with high ambient temperatures or where heat dissipation is marginal, fans or blowers may be used to improve dissipation.

## Heat Dissipation Curves

Determine your slip RPM requirements and torque requirements. Where the two points intersect must be under the curve for the unit selected. Remember to check at both minimum and maximum torque-speed conditions.

### MPC/MPB Clutches/Brakes

\*Adjacent symbol denotes shape of blower.

# POB Series Brakes

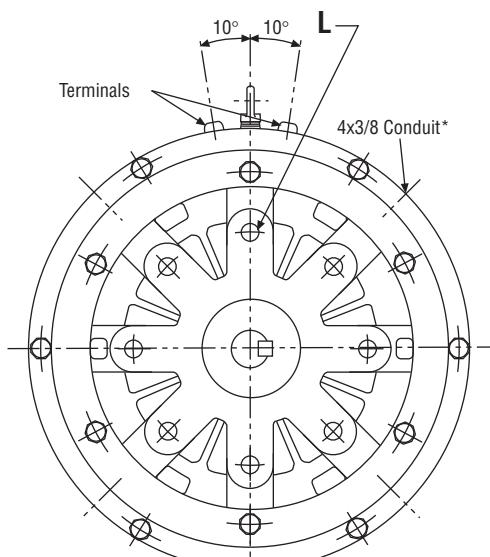

Low and high torque units are offered in this model. All units have male input shafts and pilots for mounting, except for the size 80, which is foot-mounted.

# PMC Series Clutches/Brakes

These units offer precise control in the small tension ranges. They have flanged input hubs and double-ended output shafts for maximum mounting flexibility. They can be easily mounted as clutches or brakes.

# MPC Series Clutches

Low and medium torque units for light duty rewind applications. Shaft in-shaft out with pilots, allow for sample mounting. Optional brackets available.

Optional mounting bracket, see page 116.

All dimensions are nominal unless otherwise noted.

This model has a hollow bore, making it ideal for applications where shaft mounting is preferred. It has a piloted input flange for pulley or sprocket attachment.

**Note:** This is a stationary field clutch. The tapped holes "L" in the field are for securing the housing to prevent it from rotating. This can be done with cap screws (see figure 3, page 32) or with a restraining strap. Do not block ventilation openings when mounting.

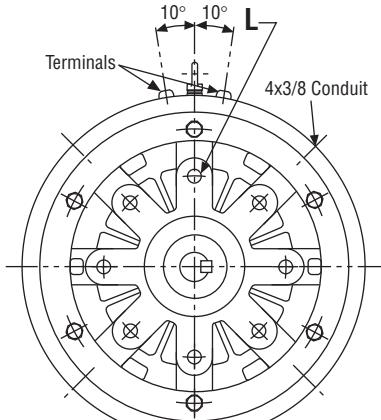

# POC Series Clutches

This model is preferred in many applications. It is offered with male input and output shafts and all units are pilot mounted, except for the size 80. This largest unit, the size 80, is foot mounted.

All dimensions are nominal unless otherwise noted.

**Note:** All MPC Series clutches require 2 mounting brackets.  
MPB Series brakes require 1 mounting bracket.

### Optional Torque Arm (for shaft mounting PRB-H and PRB-HF Brakes)

inches/(mm)

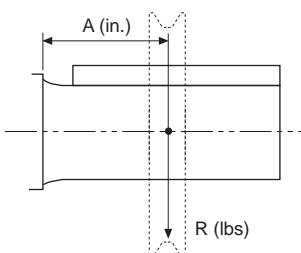

Model	Part Number	A inches (mm)	B inches (mm)	C inches (mm)
PRB-1.2H/HF	5401-101-001	9.03 (229.4)	1.50 (38.1)	0.31 (7.9)
PRB-2.5H/HF	5401-101-001	9.03 (229.4)	1.50 (38.1)	0.31 (7.9)
PRB-5H/HF	5401-101-002	11.19 (284.2)	1.50 (38.1)	0.38 (9.5)
PRB-10H/HF	5401-101-002	11.19 (284.2)	1.50 (38.1)	0.38 (9.5)
PRB-20H/HF	5401-101-003	19.31 (490.5)	2.38 (60.3)	0.38 (9.5)

All dimensions are nominal unless otherwise noted.

## Overhung Load

When an overhung load (side load) is applied to the shaft, verify that this load does not exceed the maximum allowable. Operating speed and where the load is applied to the shaft (see Dimension A, Figure 4) must be known. For speed, determine the speed coefficient from the coefficient table. Also, determine the allowable overhung load from the chart based on Dimension A.

Multiply the load from the chart times the speed coefficient to determine the allowable load for the application.

**Figure 4**  
**Overhung Load**

**Note:** Shaft extensions are not recommended.

## Pulley or Sprocket Load

For most applications, the overhung load is caused by pulleys or sprockets. The smaller the pitch diameter (PD) of the pulley or sprocket, the higher the belt or chain tension, and, therefore, the greater the overhung load. To determine the minimum pulley diameter for the application, use the following equation:

$$\text{Minimum PD (in.)} = \frac{24 \cdot TK}{CR}$$

T = Torque (lb.ft.) This is the torque actually being transmitted, not necessarily the maximum torque capacity of the brake.

K = Safety factor for the tension in type of drive. Use 1.2 to 1.5 for sprockets, 2 to 4 for belts.

C = Speed coefficient from table.

R = Radial load allowable at 1,000 RPM.  
(The allowable radial loads for various locations on the shaft are given in the Allowable Load chart.)

**Example:** Determine the minimum sprocket diameter that can be used on a PRS-5S. Dimension A is 1.1 inches, the torque requirement is 20 lb.ft. and the speed is 600 RPM.

$$\text{Minimum PD (in.)} = \frac{24 \times 20 \times 1.5}{1.2 \times 214}$$

$$= 2.8 \text{ inch minimum PD}$$

## Allowable Overhung Load

Type	A (in.)	R (lbs.)	A (in.)	R (lbs.)	A (in.)	R (lbs.)
<b>MPB2/MPC2</b>	.40	5	.50	4	.80	2.5
<b>MPB15/MPC15</b>	.40	25	.50	20	1	10
<b>MPB70/MPC70</b>	.40	37.5	.50	30	1.25	12
<b>MPB120/MPC120</b>	.50	30	1	15	1.5	10
<b>MPB240</b>	.50	50	1	25	1.5	16
<b>POC/POB-0.3</b>	.40	30	.50	28	.90	22
<b>POC/POB-0.6</b>	.40	45	.50	42	1.0	29
<b>POC/POB-1.2</b>	.40	52	.70	43	1.4	31
<b>PRB-1.2S/SF</b>	.40	73	.70	66	1.4	60
<b>POC/POB-2.5</b>	.40	88	.90	67	1.7	48
<b>PTB-2.5BL3</b> <b>PRB-2.5S/SF</b>	.40	125	.90	104	1.7	82
<b>POC/POB-5</b> <b>PTB-5BL3</b>	.40	204	1.1	136	2.2	93
<b>PRB-5S/SF</b>	.40	286	1.1	214	2.2	165
<b>POC/POB-10</b>	.40	313	1.3	235	2.6	159
<b>PTB-10BL3</b> <b>PRB-10S/SF</b>	.40	433	1.3	368	2.6	282
<b>POC/POB-20</b> <b>PTB-20BL3</b>	.40	379	1.4	265	2.8	198
<b>PRB-20S/SF</b>	.40	521	1.4	412	2.8	348
<b>POC/POB-40</b>	.40	581	1.8	432	3.6	324
<b>POC/POB-80</b>	.40	860	2.2	648	4.3	498

**Note:** This table is based on 1,000 rpm and a bearing life of 6,000 hours. Also, this table assumes that no thrust load is applied.

## Speed Coefficient

Speed (rpm)	Speed Coefficient	Speed (rpm)	Speed Coefficient
50	2.74	1,000	1.00
100	2.18	1,200	0.95
200	1.72	1,400	0.89
400	1.37	1,600	0.86
600	1.20	1,800	0.82
800	1.09	2,000	0.80
